OPTICAL & MECHANICAL PROPERTIES

LED light has been getting used at a various Lighting applications such as lighting fixtures and LED indicator because of its low energy consumption. However, LED light is spot light source and people feels uncomfortable to the glare. Acrylic was the suitable material for diffusers to provide controlling the glare, hide the spot and convert spotlight to area light.

With great light transmission plus UV resistance and anti- yellowing feature Polycarbonate lighting grades are the new industry touchstone for LED light diffusion. Break resistant, easy to cut-to-size, reduce glare, provide pinpoint brightness and enhance visual comfort.

Polycarbonate is mainly used for electronic applications that capitalize on its collective safety features. Being a good electrical insulator and having heat-resistant and flame-retardant properties

Mechatech LED profiles has wide range of ready-made portfolio in terms of the anodized aluminum profiles, flame retardant, diffuser colors and light diffusion properties. It allows responding sudden requirements changes and last minutes' design change.

In general, the higher light diffusive material the more loss of its light, however, Mechatech LED Profiles employs proprietary technology to minimize the loss. The higher light output of the fixture can be achieved with using diffuser covers made out best optical grades of Polycarbonate.

PMMA (Acrylic) vs PC (Polycarbonate)

Thought of touching the basics

1. PMMA has 17 times the impact resistance of glass. PC has 250 times the impact resistance of glass.
 2. PMMA is very rigid whereas PC can be bought in flexible grades. Acrylic cracks more easily than polycarbonate under stress.
 3. PMMA has light transmittance of 92 percent and PC has a light transmittance of 88 percent in comparison to glass.
 4. PMMA can handle temperatures up to 90C while PC can handle temperatures up to 115C.
 5. PMMA will crack if it is drilled near an edge or with a drill bit not designed for plastic. PC typically does not crack when being drilled even if drilled close to the edge with a standard drill bit.
 6. PMMA has a low chemical resistance. PC has a higher chemical resistance than PMMA.
 7. PMMA is more likely to chip than PC because it is less impact-resistant. It does not scratch easily, however, PC will not yellow over time.
 8. PC has no flammability, while PMMA will burn slowly like a candle and is not recommended in areas where flames may be present.
 9. PC is more expensive than PMMA. It tends to cost about 45% more
-

FEATURES & TECHNICAL DETAILS

Overview

ME Series Aluminum profiles/channel is made of sturdy anodized aluminum metal, and has a specific design to protect LED strip and create softer lighting effect.

Aluminum profile/channel is a great housing and excellent heat sink for flexible LED strips. The profile is widely used for under cabinet, under stairs, closets. Exhibits furniture, workstations, or any other visible installations where the strips lighting is exposed. The profiles are supported by snap on covers in Clear, Opal matt and Frosted diffusers

Features

- Premium quality extruded anodized Aluminum
- Compatible with 8mm, 10mm, 12mm LED strips
- Premium quality PC light diffusers
- Excellent Heat sink
- Non Recessed model

Technical Details

Finish	Anodized Silver
Standard Length	2000mm
Max Length	6000mm
Accessories	End Caps/Mounting Brackets
Diffuser Option	Clear/Frosted/Opal
Use	Indoor/Outdoor

**LEXAN™ COPOLYMER POLYCARBONATE RESINS

PROPERTIES OF LEXAN™ RESIN FROSTED & OPAL

LEXAN (PC) resin frosted is a non-filled, extricable grade. This non-chlorinated, non-brominated flame retardant PC has an UL-94 V0 rating at 1.0 mm / 5VA rating at 3.0mm and is UV stabilized (F1 rating) providing additional weathering capability.

TYPICAL PROPERTIES ¹	TYPICAL VALUE	Unit	Standard
